

Cardiovascular Clinical Trial

Is your high cholesterol level increasing your risk of having a major cardiovascular event?

Consider joining the VICTORION-1 PREVENT study

The VICTORION-1 PREVENT study will assess if an investigational drug can prevent cardiovascular events (such as heart attacks, strokes, procedures to improve blood flow, and death) in adults who are at high cardiovascular risk and who have high levels of low-density lipoprotein (LDL) cholesterol (also called 'bad' cholesterol), but have not yet had a major cardiovascular event.

We are looking for people to join this study who:

- Are 40 to 79 years of age
- Have high LDL cholesterol levels
- Have not experienced a major cardiovascular event
- Are considered high risk of having a major cardiovascular event in the future

To find out if you could join, or for more information, please contact the study team using the details below.
